Such computing facilities house and accommodate a large amount of server, network, and computer equipment to process, store, and exchange data as needed to carry out an organization's operations. Typically, a computer room of a computing facility includes many server racks. Each server rack, in turn, includes many servers and associated computer equipment. According to a conventional configuration, a large server rack, or blade chassis, is typically housed in a container, such as a standard 19' or 23' rack mount, and many racks are placed in a rack farm. The rack farm is housed in a building that often may hold many rack farms. In some instances, most of the servers in the computing facility are housed in the building. Determination of acrylamide in food by GC-ECD and LC-MS: A review. A review of the literature for the analysis of acrylamide in food was performed to evaluate the performance, capabilities, and limitations of various analytical methods. The review focused on different detection modes, instrumental detection methods, derivatization and extraction techniques, the optimization of the sample and extraction parameters, and on the analysis of the extracts or foods by GC, GC-MS, and LC-MS. The capillary chromatographic methods, especially gas chromatography coupled with mass spectrometry, are the most widely used detection mode for acrylamide. The derivatives usually used for derivatization are methyl chloroformate and dansyl chloride. The most commonly used extraction techniques are with, without, and purification steps.
